

# 3V Architectural Hardware® 3Cycle

3V is committed to leading the industry in the responsible reuse and recycling of architectural ironmongery.

Subject to survey, we are pleased to collect, at no cost to the contractor, any previously installed satin stainless steel 3V ironmongery that has been removed from the door, packaged in the supplied 3V cartons, and made available for collection.

A wide range of components can be fully refurbished and returned to market, including lever handles, pull handles, escutcheons, roses, door stops, coat hooks, grab rails, and W.C. indicator turn-and-release sets. The majority of these products already contain approximately 80% recycled content from their original manufacture, and refurbishment further extends their lifecycle with minimal environmental impact. Cost is subject to Site Survey, with a 10 year extended warranty available following refurbishment.

Due to the complexity and performance requirements of certain mechanical items, such as hinges, lock cases, door closers, floor springs, and cylinders, reuse or reconditioning is not feasible. These components must meet stringent fire and life-safety standards, and the energy, material input, and cycle testing required to return them to a certified condition would outweigh any environmental benefit. However, all such items can still be responsibly recycled and repurposed, ensuring that valuable materials are not lost.
